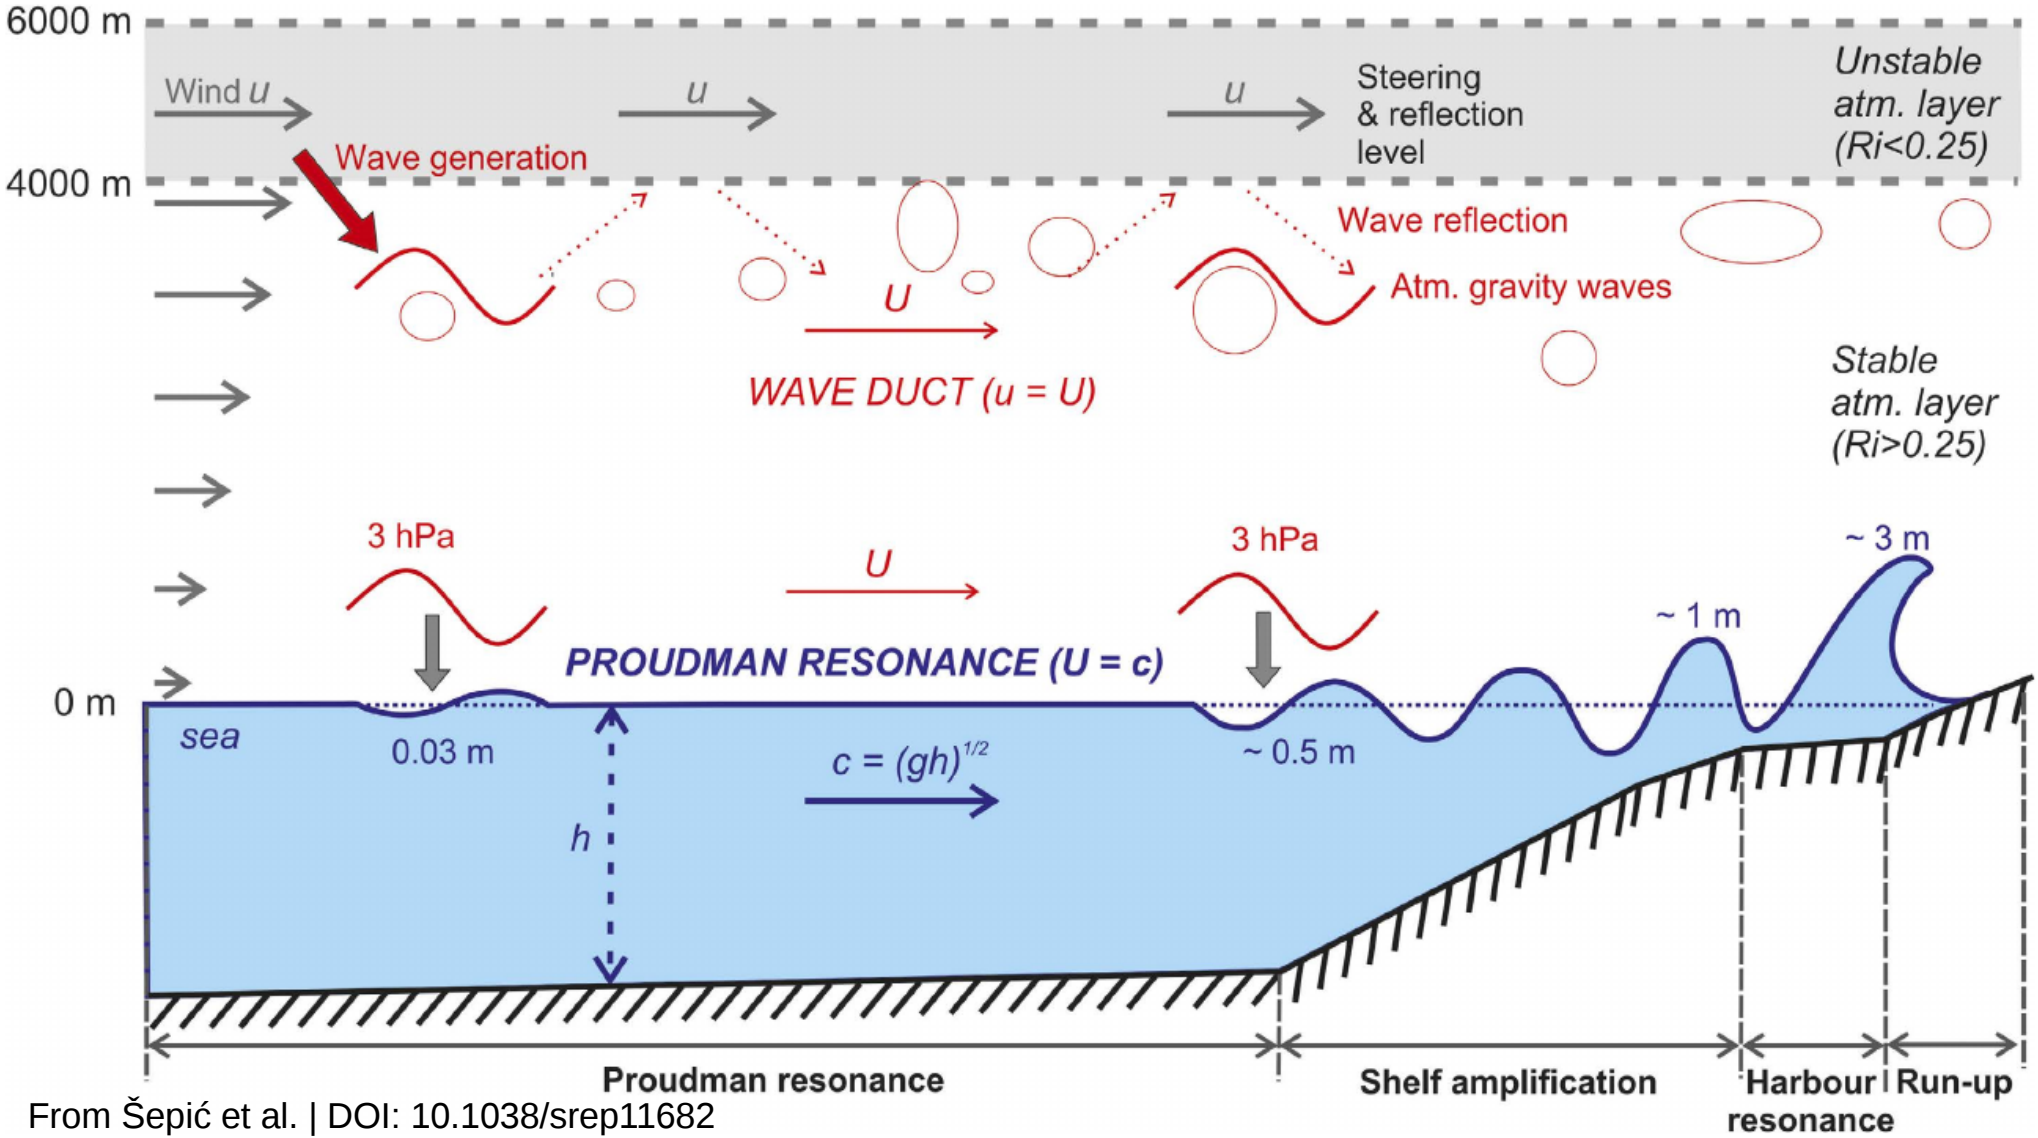
MESSI final meeting, Split, Croatia, 12.12.2017.

Outline

- What is needed to forecast meteorological conditions that cause meteorological tsunamis?
- Which meteorological conditions cause them?
  - Gravity waves
  - Synoptic setting
- Results using 2 km non-hysrostatic ALADIN System ALARO CMC
- Project: “Meteotsunamis, destructive long ocean waves in the tsunami frequency band: from observations and simulations towards a warning system” (MESSI)

Definition

- **A meteotsunami or meteorological tsunami is a tsunami-like wave of meteorological origin.**
- 10% of tsunamis worldwide have unknown origin
- 3% already assigned to meteorological conditions
- atmospheric gravity waves, pressure jumps, frontal passages, squalls ...
- local names: rissaga (Catalan), ressaca (Portuguese), milghuba (Maltese), marrobbio (Italian), abiki (Japanese), šćiga (Croatian)
- It is a rare event, but in Cro: 28 Jun, 1 and 11 Jul 2017



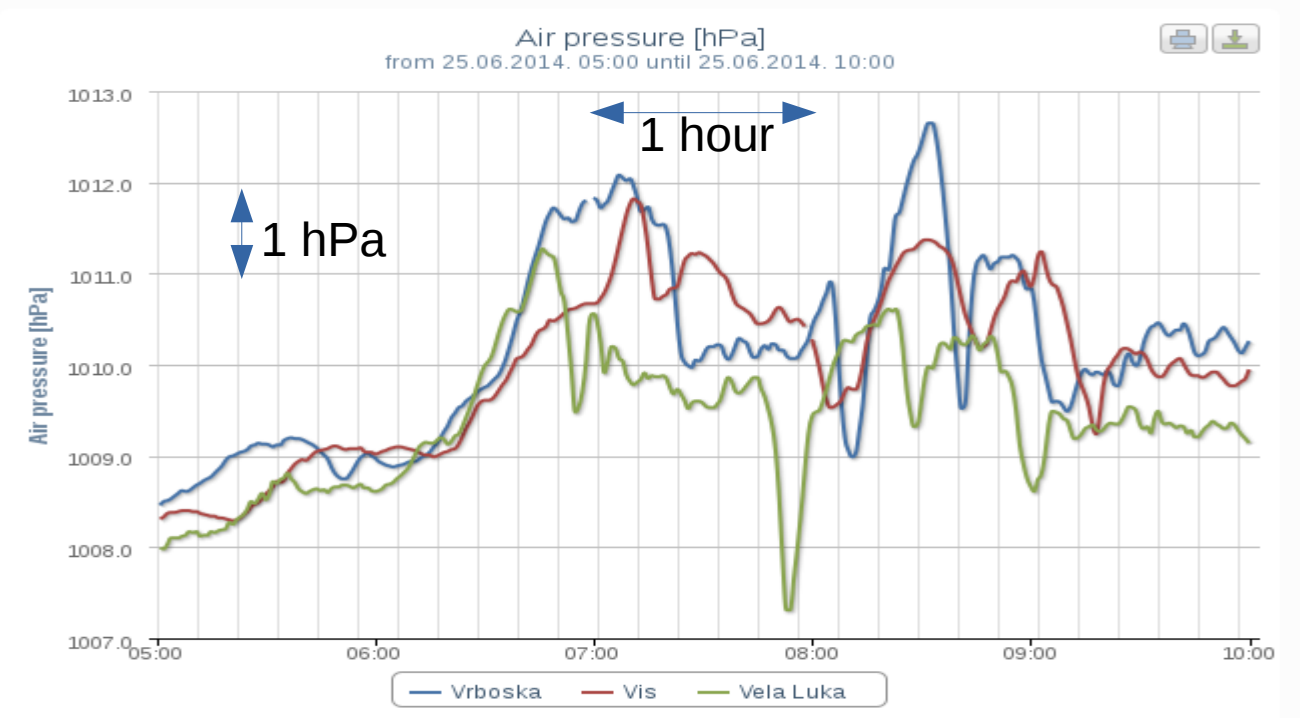
From Šepić et al. | DOI: 10.1038/srep11682

Forecasting meteotsunamis requires

- **Synoptic setting**:
  - Inflow of warm air from Africa ~850 hPa
  - SW jet > 20 m/s at ~500 hPa
  - Unstable layer (Ri<0.25) 400-600 hPa
- High resolution: Forecasting a pressure change of more than 1hPa/1min
- Model output every minute
- Pressure disturbance moving
  - in the right direction (direction of SW jet)
  - at the right speed (speed of SW jet)
  - (at the right time)

Can these pressure disturbances be forecast by an operational NWP model?

Figure: Air pressure measured on stations Vrboska (blue, Hvar island), Vis (red) and Vela Luka (green) with one second data interval during a widespread meteotsunami event on 25-26 June 2014, maintained by IOF .



Can these pressure disturbances be forecast by an operational NWP model?

Summary

- **Definition: A meteotsunami or meteorological tsunami is a tsunami-like wave of meteorological origin.**
- Causes: atmospheric gravity waves, pressure jumps, frontal passages, squalls …
- Sensitive to LBC and dynamics setting (physics not excluded)
- Can be sensitive to SST and topography representation
- **If large scale forecast providing LBCs is correct – High resolution ALADIN System can forecast meteorological conditions that lead to meteotsunamis.**
